Introduction

Problem Statement:

IDS aims to enable users to add view and edit update POIS in a 360 view

Solution: We leveraged Krpano's inbuilt functions and we implemented react components that handled mouse interactions with Krpano. This enabled us to create, delete, and modify hotspots.

Empire State Building
Width: 260 ft Height: 1250 ft
Built date: 1930 – 1931 AD

React JS

Example

For example, to change the color mode of a dropdown menu, add `data-bs-theme="light"` or `data-bs-theme="dark"` to the parent `.dropdown`. Now, no matter the global color mode, these dropdowns will display with the specified theme value.

Default dropdown

Dark dropdown

MILESTONES

- ✓ Milestone 1 - POI Creation
- ✓ Milestone 2 - POI Data Display
- ✓ Milestone 3 - Spatial Accuracy
- ✓ Milestone 4 - POI Management
- Milestone 5 - Integrate into React UI

Looking Forward

- Implement an ML Model we would integrate react logic
- Implement a third side bar that would have a list from our database that would focus in on a hotspot
- The ability to change the ID dynamically.
- Adding a UI to upload a 360 image xml file to view with our app.
- Exporting a copy of JSON to a database using PostgreSQL
